If you enjoy reading it and wish to submit it, we hope that the reading is strengthening your mental muscles. we are strongly committed to publishing debut and emerging writers.

Disclaimer: Information provided in this magazine is purely for research and education purpose only.

IVF Child

Are IVF babies normal? The simple answer is yes. Millions of babies have been born using In Vitro Fertilization (IVF) and they are perfectly healthy. The procedure does not pose any short term or long-term risk to the health of the child. The primary difference between IVF babies and normal babies is the way in which they are conceived.

IVF and Natural Conception

It is always important to compare the process of IVF and natural conception to reach to a conclusion. One thing which is common is that both the processes involve the fertilization of the eggs by the sperm. The natural process takes place in the fallopian tube (after sexual intercourse). In IVF the fertilization takes place in a dish in a special lab designed for the process. In the natural conception, the formed embryo travels to the uterus where it is naturally implanted for pregnancy. On the other hand, the lab-created embryo(s) are implanted in the embryo artificially.

It is very important to know that after the embryo(s) are implanted in the uterus the following phases are the same as natural conception. Hence, if you think logically, you will understand that the health of a test tube baby is not at all stake. They can be as healthy and ailment free as a baby born through a natural pregnancy.

Do IVF babies bear higher health risks?

Research has shown that the factors that are responsible behind the abnormalities could be male or female fertility and ages of the parents rather than the process itself.

First IVF Baby

Louise Joy Brown (born 25 July 1978) is an English woman who was the first human to have been born after conception by in vitro fertilization experiment (IVF). Louise Joy Brown was born at Oldham General Hospital, Lancashire, by planned Caesarean section. She weighed 2.608 kg at birth. Her parents, Lesley and John Brown, had been trying to conceive naturally for nine years, but Lesley faced complications of blocked fallopian tubes.

On 10 November 1977, Lesley Brown underwent a procedure, later to become known as in vitro fertilization (IVF), developed by Patrick Steptoe, Robert Edwards and Jean Purdy. Although the media referred to Brown as a "test tube baby",

her conception actually took place in a Petri dish. Her younger sister, Natalie Brown, was also conceived through IVF four years later, and became the world's 40th child after conception by IVF.

In May 1999, Natalie was the first human born after conception by IVF to give birth without IVF.

In 2004, Brown married doorman Wesley Mullinder Dr Edwards attended their wedding. Their first son, conceived naturally, was born on 20 December 2006.

The technique became widely used, and over the next three decades IVF and other assisted reproductive technologies (ARTs) produced some more than 50 million babies globally.

The birth of Louise Brown is a living proof that ivf babies are normal. she is emotionally stronger. while growing up as first test tube baby she must had lot of challenges in acceptance of society but now she is ray of hope to many couple going through fertility challenges.
